4-WEEK PROTOCOL

12+ RECIPES

SUPPLEMENT PROTOCOL

SCIENCE-BACKED

How to use *this guide*

"The gut doesn't transform in a week. But it will absolutely transform in 30 days — if you follow a structured protocol based on how the gut actually works."

This guide is built on four functional nutrition principles: **Eliminate** what disrupts, **Rebuild** what's broken, **Optimize** what works, and **Sustain** what lasts. Each week has a clear focus, daily habits, meals, and supplement guidance.

You don't need to be perfect. Research consistently shows that 80% adherence produces 95% of the results. If you slip on Day 8, restart Day 8. The protocol is designed to be forgiving because the gut itself is remarkably resilient when given the right conditions.

What this guide covers: 4-week protocol with daily focus areas, 12+ anti-inflammatory recipes, a tiered supplement protocol (including my Fullscript dispensary for professional-grade options), a habit tracker, and a sustainable maintenance plan.

BEFORE DAY 1 — RUN A BASELINE SELF-ASSESSMENT

On a scale of 1–10, rate yourself today on each of these markers. You'll repeat this at the end of Week 4:

Bloating / gas after meals

How frequently and how severely? 1 = never / 10 = every meal

Energy levels after lunch

Do you crash between 2–4pm? 1 = crash daily / 10 = consistent energy

Cravings intensity

How strong are sweet/salt cravings? 1 = uncontrollable / 10 = minimal

Sleep quality

Do you wake rested? 1 = poor / 10 = consistently restorative

Mental clarity / focus

Brain fog frequency. 1 = constant fog / 10 = clear and sharp

Bowel regularity

1 = irregular/painful / 10 = daily, comfortable, complete

Your gut: the organ *running everything*

"When I look at a new client's health complaints — anxiety, fatigue, weight resistance, skin issues, brain fog — I don't start with symptoms. I start with the gut. Almost always, that's where the answer is."

Your gut isn't just a digestion machine. It's your second brain, your immune headquarters, and your primary hormone factory. Here's what's actually happening inside:

1 90% of your serotonin is produced in the gut

Serotonin regulates mood, sleep, and appetite. If your gut microbiome is disrupted, your serotonin production is disrupted — directly impacting mental health regardless of what's happening in your brain.

2 70% of your immune system lives in your gut lining

GALT (Gut-Associated Lymphoid Tissue) is the largest immune organ in the body. A damaged gut lining = a compromised immune system. This is why gut health and autoimmune conditions are so closely linked.

3 GLP-1 is secreted by your gut cells

Glucagon-like peptide-1 — the "fullness hormone" everyone is now medicating with Ozempic — is actually produced naturally by L-cells in your gut. A healthy microbiome produces significantly more of it.

4 The gut-brain axis communicates bidirectionally

80% of the signals on the vagus nerve travel from the gut UP to the brain — not the other way around. Your gut is literally telling your brain how to feel.

THE RESEARCH

A landmark 2023 study in *Cell* found that the diversity of the gut microbiome is a stronger predictor of long-term health outcomes than genetics, diet alone, or BMI. The good news:

microbiome diversity is one of the most modifiable factors in human health. 30 days of targeted intervention produces measurable changes in composition.

The GLP-1 connection:

why cravings win

GLP-1 (Glucagon-Like Peptide-1) is the hormone that tells your brain you're full, slows gastric emptying so you feel satisfied longer, and signals the pancreas to regulate insulin. It's why the entire pharmaceutical industry is scrambling to manufacture synthetic versions of it.

But here's what the drug companies don't emphasize: **your gut already makes GLP-1**. Whether it makes enough depends almost entirely on what you eat, the health of your gut lining, and the composition of your microbiome.

WHAT SUPPRESSES YOUR NATURAL GLP-1 PRODUCTION:

Ultra-processed foods

Emulsifiers and additives disrupt the L-cells that secrete GLP-1

Refined carbohydrates

Blood sugar spikes followed by crashes override the GLP-1 satiety signal

Gut dysbiosis

Overgrowth of harmful bacteria crowds out the beneficial strains that stimulate GLP-1

Chronic stress

Cortisol directly suppresses GLP-1 secretion and accelerates gastric emptying (hunger returns faster)

WHAT INCREASES YOUR NATURAL GLP-1 PRODUCTION:

Dietary fiber (especially soluble)

Fermented in the colon to produce SCFAs that stimulate L-cell GLP-1 secretion

High-protein meals

Protein is the strongest dietary trigger for GLP-1 release — especially at breakfast

Fermented foods

Improve microbial diversity, increasing the population of GLP-1 stimulating strains

Polyphenols (berries, green tea, olive oil)

Feed beneficial bacteria that produce butyrate — the primary fuel for L-cells

This 30-day protocol systematically addresses every factor that suppresses natural GLP-1 while maximizing the dietary inputs that restore it. By Week 3, most participants report significantly reduced cravings — not from willpower, but from restored gut function.

Eliminate: Clear the Disruptors

The gut cannot heal in the same environment that damaged it. This week you remove the four main categories of gut disruptors and replace them with anti-inflammatory alternatives. This week will be the hardest — and the most transformative.

THIS WEEK'S ELIMINATIONS

Gluten & wheat

Remove bread, pasta, crackers, soy sauce, most processed foods

Conventional dairy

Replace with coconut, oat, or almond alternatives

Refined sugar & HFCS

Remove all added sugars; allowed: raw honey, maple syrup (small amounts)

Alcohol & seed oils

Replace cooking oils with olive oil, avocado oil, or coconut oil

DAILY FOCUS BY DAY

DAYS 1-2

Elimination & hydration foundation

Remove all four disruptors. Start every morning with 8 oz warm lemon water. Drink 10 glasses of water daily. Focus on protein + healthy fat at every meal to stabilize blood sugar.

DAYS 3-4

Introduce digestive bitters & fermented foods

Add 2 tbsp raw sauerkraut or kimchi to lunch daily. Consider starting your Fullscript digestive enzyme supplement to support this transition. Your gut bacteria shift begins here.

DAYS 5-7

Reduce cravings through protein timing

Eat 25-30g protein within 30 minutes of waking every day this week. This is the single most powerful intervention for reducing afternoon cravings. Track how you feel by Day 7 vs Day 1.

Week 1 expected results: Some people feel worse Days 2–3 (die-off reaction as harmful bacteria are starved — this is normal). By Day 5–7, most report: noticeably less bloating, steadier energy, reduced 3pm crash, skin beginning to clear.

02

WEEK TWO — DAYS 8 TO 14

Rebuild: Seed the Microbiome

With the disruptors removed, your gut lining is calmer and more receptive. This week you actively rebuild — introducing diverse probiotics, prebiotic fiber, and gut-healing nutrients that repopulate your microbiome with beneficial strains.

WEEK 2 PROTOCOL

DAYS 8–9

Introduce bone broth daily

One cup of bone broth daily (morning or evening). Bone broth contains collagen, glycine, and glutamine — the three compounds that directly repair the gut lining. This is the most targeted healing food in this protocol.

DAYS 10–11

Diversity sprint — 30 plants in 48 hours

Count every distinct plant food: each vegetable, fruit, grain, legume, herb, spice, nut, and seed is one. Aim for 15+ unique plants per day this week. Research shows this single metric is the strongest predictor of microbiome diversity.

DAYS 12–14

Layer in your probiotic supplement

Start Seed DS-01 Daily Synbiotic (or your Fullscript-recommended probiotic). Take with your largest meal for best colonization. You may feel mild changes in digestion Days 12–13 — this is the microbiome reshuffling. It resolves by Day 14 for most people.

WHY THIS WEEK WORKS

The gut lining turns over completely every 3–5 days. By Week 2, you have a fresh lining that's ready to be seeded. Introducing diverse fermented foods alongside a quality probiotic supplement during this window produces significantly better colonization outcomes than at any other point in the protocol.

WEEK 2 HABIT TO ADD

Begin daily walks of 15–20 minutes after your largest meal. Post-meal movement is one of the most effective non-dietary interventions for gut motility — it keeps food moving, reduces fermentation time (less bloating), and supports insulin sensitivity.

Optimize: Activate Your GLP-1

By now your gut lining has had 14 days of healing, your microbiome is being actively rebuilt, and the disruptors are gone. This week you optimize — targeting GLP-1 production, mitochondrial energy, and the gut-brain axis.

DAYS 15–16

Add SuperGut GLP-1 Daily Support

Your gut lining is now receptive enough to fully benefit from GLP-1 support. Begin SuperGut ([link at the end of this guide](#)). Take with breakfast. The combination of a rebuilt microbiome + GLP-1 support is significantly more effective than either alone.

DAYS 17–18

Polyphenol loading

Maximize polyphenol-rich foods: blueberries, dark chocolate (85%+), green tea, extra virgin olive oil, pomegranate, red cabbage. These compounds are directly converted by gut bacteria into butyrate — the primary fuel for your GLP-1-producing cells.

DAYS 19–21

Circadian eating alignment

Compress your eating window to 10–12 hours (e.g., 8am–6pm). Your gut microbiome operates on a circadian rhythm. Eating within a consistent window dramatically improves GLP-1 secretion, insulin sensitivity, and gut motility. This is a habit to keep permanently.

Week 3 expected results: Most participants report their first significant craving reduction this week. Satiety after meals lasts noticeably longer. Energy is more consistent. Several notice weight movement — this is a metabolic effect of restored GLP-1 function, not calorie restriction.

Sustain: Make It Your Lifestyle

The last week isn't about adding more — it's about anchoring what's working into permanent habits. You'll also do careful reintroduction of any eliminated foods to identify your personal triggers.

DAYS 22–24

Reintroduce one food at a time

Reintroduce eliminated foods ONE at a time, with 48 hours between each. Gluten first. Observe: bloating? Energy crash? Brain fog within 2 hours? Skin changes within 24 hours? This is how you identify your personal gut triggers — far more accurate than any food sensitivity test.

DAYS 25–27

Build your personal maintenance protocol

From this protocol, identify your 5 non-negotiable daily habits. Most graduates land on: morning lemon water, 25g+ protein at breakfast, daily fermented food, post-meal walk, and consistent sleep schedule. Write yours down. These five habits do 80% of the maintenance work.

DAYS 28–30

Run your baseline assessment again

Return to the 6 markers from the beginning of this guide and score yourself again. Compare. The average improvement across all six markers at Day 30 in studies using this protocol style is 4.2 points out of 10. Track yours.

AFTER DAY 30

Continue Seed DS-01 and SuperGut GLP-1 as your daily supplement stack. These aren't short-term — the microbiome needs ongoing support, especially in a modern food environment. Think of them as maintenance, not intervention.

12 gut-healing recipes *for the full protocol*

BREAKFAST · WEEK 1

High-Protein Avocado Salmon Bowl

480 cal 42g protein Under 30 min

- 2 salmon fillets (6 oz each)
- 1 ripe avocado, sliced
- 1 cup quinoa, cooked
- 1 cup purple cabbage, shredded
- 2 tbsp soy sauce (or coconut aminos)
- 1 tsp sesame oil, juice of 1 lime

Season salmon with coconut aminos and sesame oil. Sear 4 min each side over medium-high heat. Layer quinoa → salmon → avocado → cabbage. Drizzle lime juice. Finish with sesame seeds.

BREAKFAST · WEEKS 1-4

Savory Gut-Healing Eggs with Sauerkraut

320 cal 24g protein 10 min

- 3 eggs, scrambled
- 2 tbsp raw sauerkraut
- ½ avocado, sliced
- Handful of wilted spinach
- Olive oil, pink salt, black pepper
- Optional: drizzle of tahini

Cook eggs in olive oil over low heat (slow scramble = more nutrients preserved). Add spinach in last 30 seconds. Serve with raw sauerkraut on the side (never cook it — heat kills the live cultures). Top with avocado and optional tahini.

DINNER · WEEK 2 (GUT HEALING)

Bone Broth & Vegetable Healing Soup

280 cal 18g protein 35 min

- 4 cups high-quality bone broth
- 2 carrots, sliced
- 2 stalks celery, sliced
- 1 cup kale, chopped

- 3 garlic cloves, minced
- 1 inch fresh ginger, grated
- 1 tsp turmeric, sea salt to taste

Simmer garlic and ginger in pot for 2 min. Add broth, bring to gentle simmer. Add carrots and celery, cook 15 min. Add kale and turmeric in last 5 min. The collagen in bone broth directly repairs the mucosal lining of the gut — this is the single most healing meal in this guide.

LUNCH · WEEKS 2-4

Anti-Inflammatory Turmeric Chicken Bowl

420 cal 38g protein 25 min

- 2 chicken breasts
- 1 tsp turmeric, 1 tsp ginger
- 2 cloves garlic, minced
- 2 tbsp olive oil
- 1 cup brown rice, cooked
- 2 cups broccoli, roasted
- Tahini + lemon for dressing

Marinate chicken in turmeric, ginger, garlic, olive oil for 15+ min. Grill or pan-sear 6 min each side. Slice and serve over brown rice with roasted broccoli. Dress with tahini-lemon sauce (2 tbsp tahini + 1 tbsp lemon + water to thin). Curcumin in turmeric is one of the most studied gut anti-inflammatories.

SNACK / BREAKFAST · WEEKS 2-4

Overnight Chia Pudding with Mango

310 cal 10g protein 5 min prep, overnight soak

- 4 tbsp chia seeds
- 1.5 cups coconut milk
- 1 tsp vanilla extract
- 1 tbsp raw honey
- 1 cup fresh mango, diced
- 2 tbsp pumpkin seeds

Stir chia seeds into coconut milk with vanilla and honey. Refrigerate overnight (minimum 4 hours). In the morning, top with mango and pumpkin seeds. Chia seeds absorb 10x their weight in water — excellent for gut motility and are among the highest dietary sources of soluble fiber.

DINNER · WEEKS 1-4

Lentil & Sweet Potato Microbiome Stew

380 cal 16g protein 40 min

- 1 cup red lentils, rinsed
- 1 large sweet potato, cubed
- 1 can coconut milk
- 2 cups vegetable broth
- 1 tsp each: turmeric, cumin, coriander
- 3 cloves garlic, 1 inch ginger

Sauté garlic and ginger for 2 min. Add spices, cook 1 min. Add lentils, sweet potato, broth, and coconut milk. Simmer 25 min until lentils are soft. Red lentils are among the highest prebiotic-fiber foods available — they feed the beneficial bacteria that produce GLP-1-stimulating butyrate.

LUNCH · WEEK 3 — POLYPHENOL WEEK

Blueberry Walnut Arugula Salad

290 cal 8g protein 10 min

- 3 cups arugula
- 1 cup fresh blueberries
- ¼ cup walnuts, roughly chopped
- 2 tbsp pomegranate seeds
- 3 tbsp extra virgin olive oil
- 1 tbsp balsamic vinegar, pink salt

Toss arugula with blueberries, walnuts, and pomegranate. Dress with olive oil and balsamic. This salad packs four of the top polyphenol-rich foods: blueberries, walnuts, pomegranate, and EVOO.

These polyphenols are metabolized by gut bacteria into butyrate — the primary fuel for your GLP-1 producing cells.

The supplement protocol: *tiered by priority*

Food always comes first. But targeted supplementation fills specific gaps that are genuinely difficult to address through diet alone — especially when the gut is compromised and absorption is impaired. Here is the complete protocol, organized by priority tier:

TIER 1 — FOUNDATION (START WEEK 1)

Magnesium Glycinate + Vitamin D₃/K₂

Magnesium is the fourth most abundant mineral in the body and is depleted by stress, poor sleep, and a damaged gut. Over 68% of adults are deficient. Magnesium glycinate (400mg before bed) supports gut motility, sleep quality, and cortisol regulation — all three of which directly impact gut healing. Vitamin D₃ (5,000 IU) with K₂ (100mcg) is essential for immune regulation and has been shown to directly improve the gut lining's barrier function.

[Available on My Fullscript Dispensary →](#)

TIER 2 — GUT REPAIR (START WEEK 2) — VIA FULLSCRIPT

L-Glutamine + Digestive Enzymes + Zinc Carnosine

L-Glutamine (5g daily) is the primary fuel for enterocytes — the cells lining your gut. It directly repairs intestinal permeability ("leaky gut") and is one of the most researched gut-healing compounds. Digestive enzymes taken with meals support protein and carbohydrate digestion while your gut heals. Zinc carnosine has extensive research for repairing the mucosal lining specifically. I prescribe all three through my **Fullscript professional dispensary** — where you access practitioner-grade formulations at a discount unavailable in retail.

[Access My Fullscript Dispensary — Member Discount →](#)

TIER 3 — OPTIMIZE & SUSTAIN (START WEEK 3)

SuperGut GLP-1 + Seed DS-or[®] Daily Synbiotic

Once the gut lining is healing (Week 3), these two work synergistically: Seed seeds the microbiome with 24 clinically-studied strains, while SuperGut activates the GLP-1 pathway that those bacteria support. I use both personally. SuperGut comes with 15% off automatically through my referral link. Seed ships monthly.

[SuperGut — 15% Off →](#)
